**SCOPE OF WORKS
FOR
PROVISION FOR EVALUATION OF EXTENDED REACH DRILLING
FROM WHP-DHN TO WHP-DH02 AREA, BLOCK 05-1(a), OFFSHORE
VIETNAM**

1. INTRODUCTION

- PETROVIETNAM Domestic Exploration Production Operating Company Limited (Hereinafter referred to as “PVEP POC” or “CLIENT”), as an Authorized Operator of Block 05.1a, is planning to acquire and subsequently conduct the Evaluation of Extended Reach Drilling from WHP-DHN to WHP-DH02 area, Block 05.1a, Offshore Vietnam (hereinafter referred to as “SERVICES”).

DAI HUNG FIELD OVERVIEW

- Location : Block 05.1a, Offshore Vietnam
- Field name : Dai Hung
- Water depth : 110 m
- Distance from Vung Tau base : 260 km
- Well Type : Subsea and Surface Xmas Tree

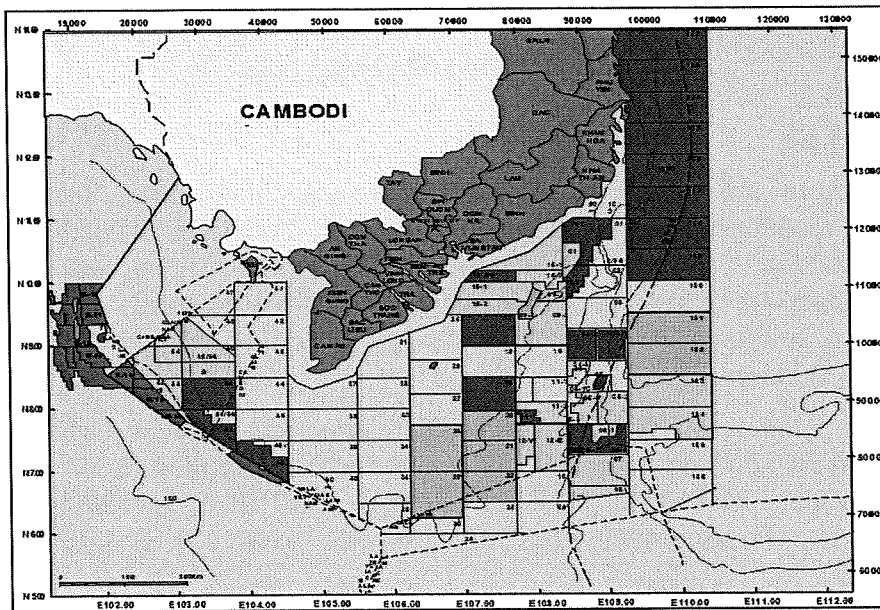

Figure 1: Dai Hung Field Location

The Dai Hung facilities utilize a Floating Production Unit (FPU-DH01), which is connected to twelve subsea wells. All located in the Early Production System Region (Northern of the field). These wells are currently connected to FPU-DH01 through flowlines and each well has its own umbilical for control of the subsea system. The crude oil is stabilized on the FPU-DH01 and offloaded to the Floating Storage and Offloading Vessel (FSO), which is moored to the Catenary Anchor Leg Mooring (CALM) Buoy. Crude oil is transferred to the CALM buoy by two dedicated

6" subsea flowlines and from the CALM buoy to the FSO by means of a floating hose. The bulk of the gas is flared and no facilities for gas lift are provided on FPU-DH01.

The fixed WHP-DH2 with 12 dry Xmas trees locates in South West direction of FPU-DH01 at a distance of approximate 5km. The platform is tied back to and remotely operated from the FPU-DH01. Two 6" subsea flowlines are used to transport liquids from the WHP-DH2 to the FPU-DH01.

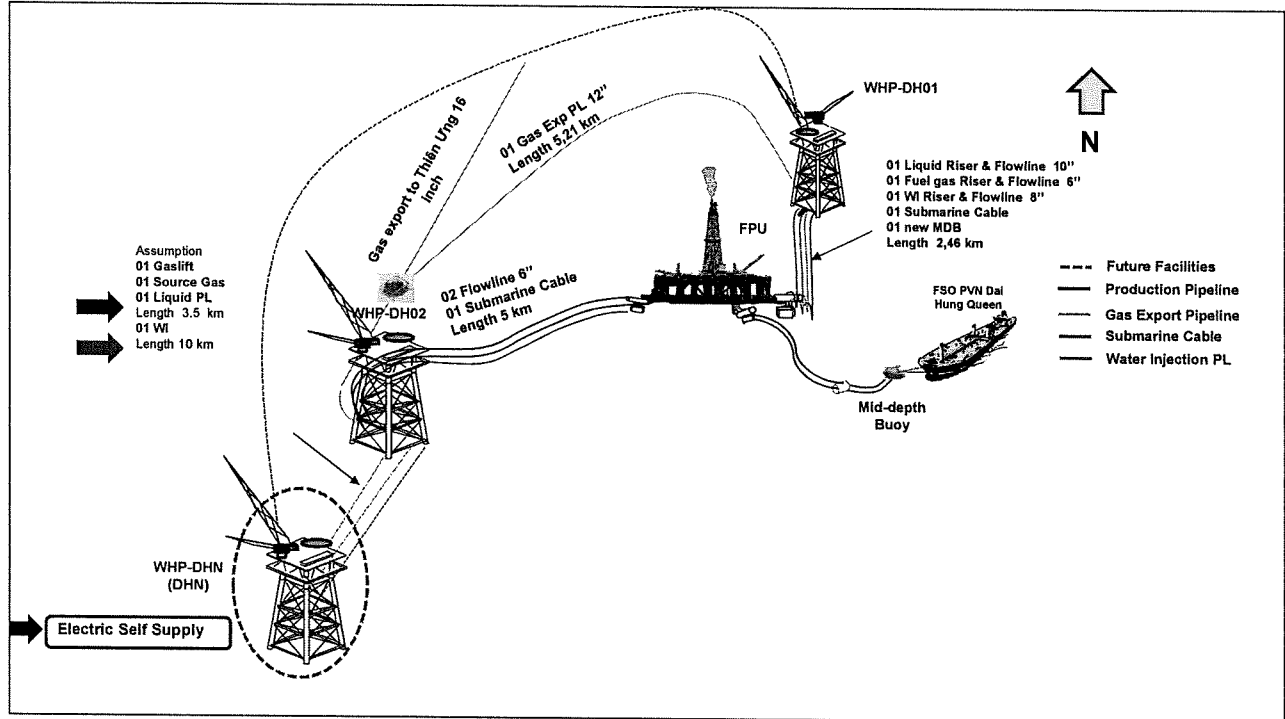

Figure 2: Dai Hung Well Map Location

2. OBJECTIVES

The objective of this work is to perform the necessary/potential evaluation and analysis to provide the recommendation/evaluation of Extended Reach Drilling application from WHP-DHN to the targets as far as could be reached in term of technical acceptance. With the continuous increase in vertical depths and horizontal displacements of directional wells, the difficulties of drilling operations continue to increase, and more accurate methods of drilling difficulty evaluation are required.

CLIENT is planning for development of DHN prospect, the WHP-DHN to be set at DHN location and then drill development wells. In order to utilize the slots on WHP-DHN to drill exploration/appraisal wells at different prospect, PVEP POC is looking for evaluation of ability to drill as far as possible from a fixed surface location (WHP-DHN).

• **Basic Concept of Well Design for Dai Hung wells:**

The recent DH wells were designed with below summaries:

- Drill 26" hole and run & cement 20" Conductor (20" Conductor shoe set at +/-500mMD to penetrate the Plio- Plietocene "Bien Dong" formation, and is expected to consist of sands, sandy/silty clays, and clays).
- Drill 16" hole and run & cement 13-3/8" Intermediate casing (13-3/8" Casing shoe set at top of Carbonate formation sequence. The 16" hole section drilled through unconsolidated Bien Dong and Nam Con Son formation to bottom of H-20/30. The formation consists of main claystone interbedded with sandstone and minor siltstone. This formation should be moderately soft and not particularly abrasive. Sandstone losses and reactive clay will affect during drilling this interval).
- Drill 12-1/4" hole and run & cement 9-5/8" Production casing (9-5/8" Casing shoe set at top of Clastic formation sequence. The 12-1/4" hole section drilled through Consolidate middle Miocene sands, shale and fractured carbonates (Thong-MangCau) encountered while drilling this interval. Thong-Mang Cau formation is divided in two parts. The upper section of the formation is predominately interbedded claystone, sandstone layers and thin limestone layers. The lower section contains carbonate platform interbedded with thon sandstone and claystone layers).
- Drill 8-1/2" hole and run & cement 7" liner casing (7" Liner shoe set at well TD. This section penetrate the Clastic reservoirs (Dua formation). The Dua formation consists predominately of sandstone interbedded with claystone. The formations should be moderately hard and more abrasive than the previous section).
- Drilling Fluid Program: 26" hole will be used SW with Hivis sweep, 16" & 12-1/4" holes will be used high performance water base mud, 8-1/2" hole will be used SOBM.
- Logging Program: MWD/LWD will be used for 16" & 12-1/4" & 8-1/2" holes.
- Well Structure: Casing shoe depth as per table #1 below with concept of 13-3/8" casing shoe will be set at top of H30 formation and 9-5/8" casing shoe will be set at top of H76.1-H76.2/H80 formations, 7" liner casing will cover all clastic section.
- Pore Pressure and Temperature prediction of DH field as per table #2 below.

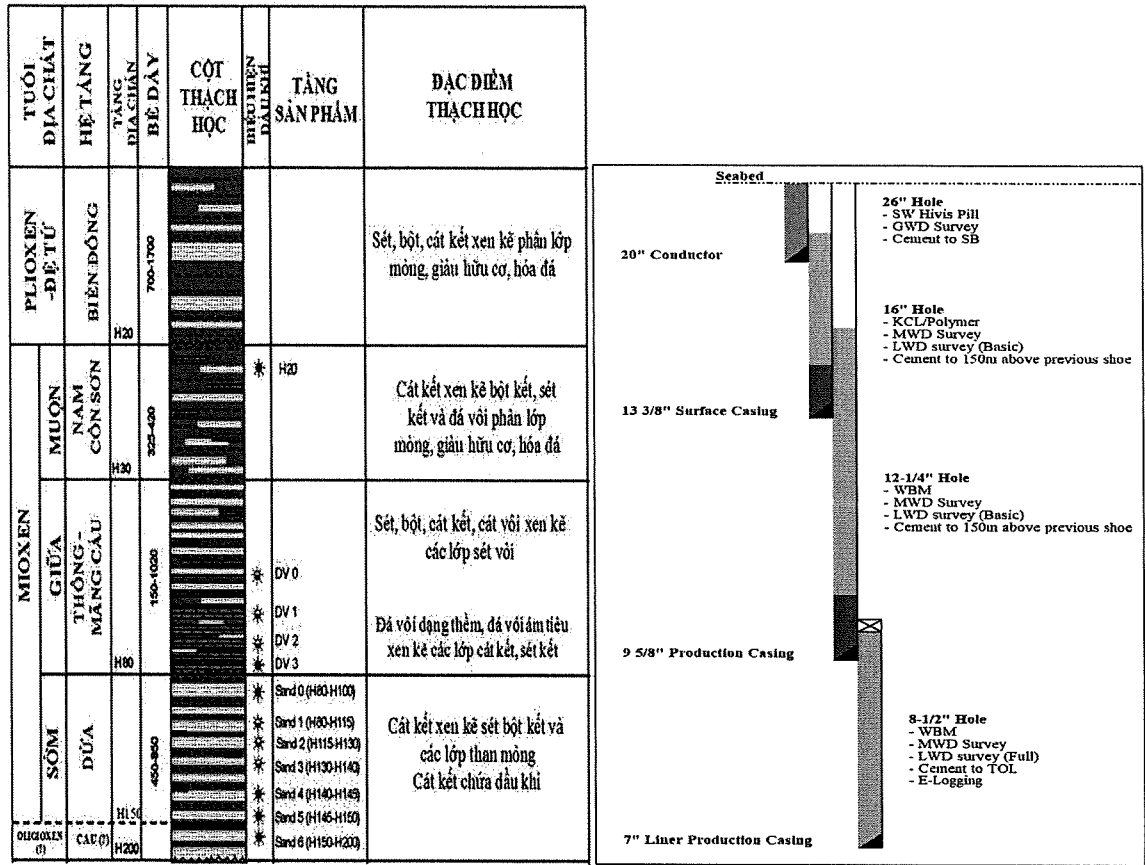

Table 1: Typical Lithology & Well Structure of DH wells

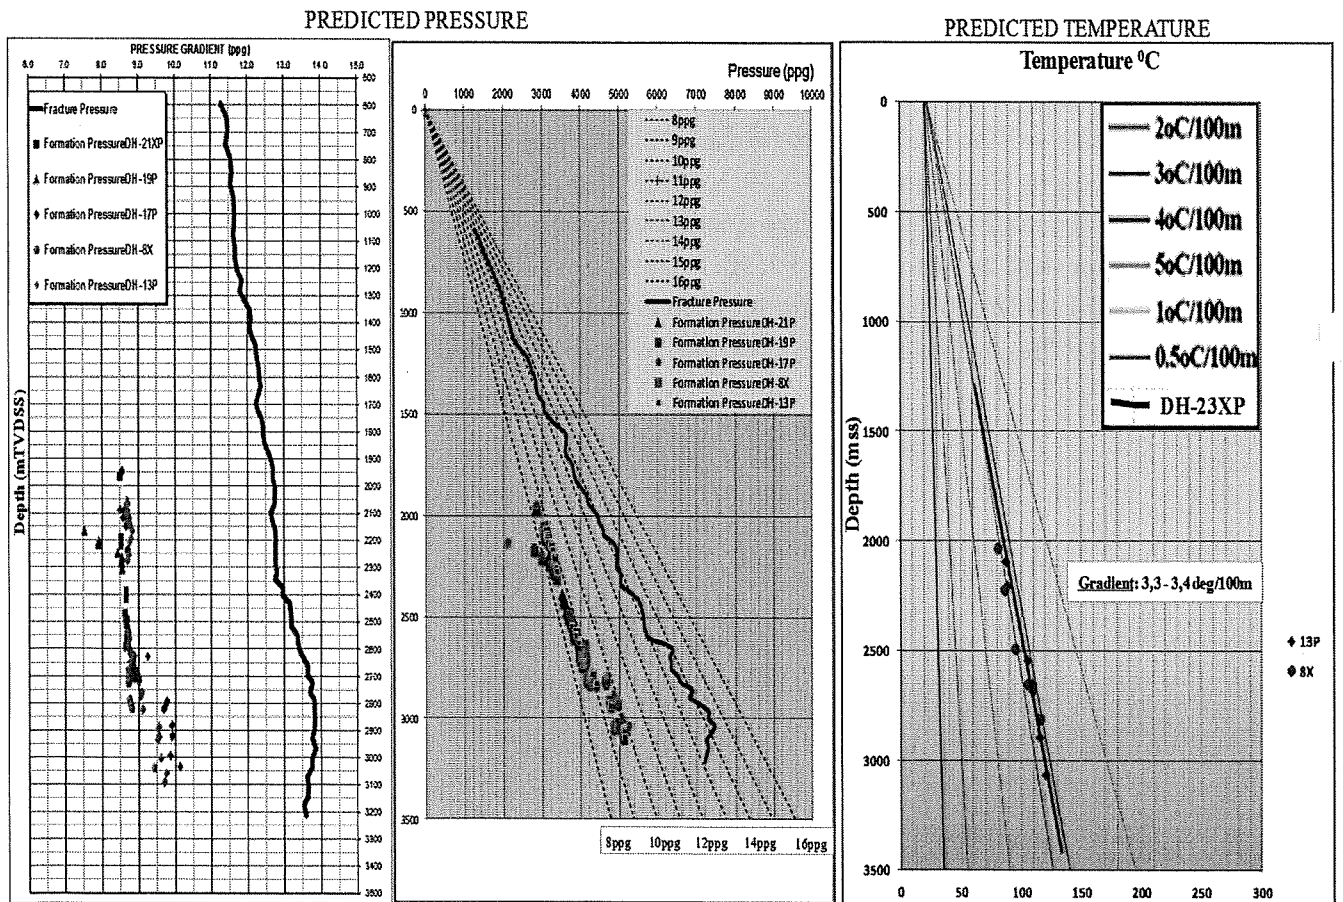

Table 2: Typical Pore Pressure & Temperature of DH02 area
